

**Working principle of the magnetization system for water softening or fuel consumption optimization:**

The 2 pieces that make up the kit are neodymium magnets create a strong magnetic field. When water or fuel passes through the magnetic field area, it is restructured and modifying the carbohydrate chain, disintegrating into smaller particles with the subsequent ionization of the same, the result of this process is; In water pipes, the crystalline structure of the minerals is altered, forming smaller and less adherent crystals. This significantly reduces scale build-up, and fuel burning in fuel lines is more efficient in the engine.

Another use is to optimize the fuel of vehicles.

Once the fuel magnets are installed, the engine is gradually cleaned of carbohydrate residues and the absence of these residues in case of subsequent use. The magnets will reduce the fuel consumption of your car by up to 25%, they will increase the power by approximately 5 horsepower, thanks to the more efficient burning the CO-CH indicators in the emission are improved.

It allows you to enjoy the following advantages:

**Reduces fuel consumption by 25%**

The neodymium magnet activates the sets of molecules that are generated in the fuel that are not normally burned but are emitted outside. Spending is reduced by 25%!

**Increases engine run time**

Prevents the creation of scale on valves, piston rings and cylinder walls.

**Reduces the emission of harmful gases into the atmosphere**

The burning of fuel in the engine becomes more efficient, and the volume of combustion gases is reduced.

**Improves car performance**

The performance of the car's engine is increased by providing its elastic performance.
